Pulsafeeder: ISOChem Metering and Transfer Pumps

Sometimes, pumps are purpose-built to address stringent requirements for specific applications—and other times, new applications emerge that fall directly into the sweet-spot of existing pumps.

The rapidly-growing CBD extraction market is a great example of a “new need for an experienced pump”—and ISOChem offers the right mix of features, performance, reliability, price, and immediate availability that CBD extractors need.

ISOChem pumps are compact, magnetically driven, sealless gear pumps designed to safely handle hazardous and expensive chemicals. For years, they've been used in a variety of industrial transfer and metering applications. This

past year, newly-enhanced versions of ISOChem (featuring sanitary connections) have seen record growth because they precisely address the needs of CBD extractors.

The ISOChem line offers the flow and pressure envelop needed to address any ethanol extraction process. Its sealless design ensures no leaks, no downtime and minimal maintenance. Its compact footprint makes it easy to incorporate into any skid, and Pulsafeeder distributors prefer ISOChem because of its price point, and the fact that it can be provisioned within hours, and shipped to the customer in a matter of days.

When it comes to pumps for CBD extraction, no single feature dominates. It's the combination of flow and pressure, sanitary connections, sealless/leak-free reliability, price, and quick availability that have enabled ISOChem to carve its niche in the rapidly-growing CBD extraction market.
